was only detected in CD1a⁺-derived DC, whereas CD68 and factor XIIIa mRNAs were observed exclusively in CD14⁺-derived DC. Semiquantitative reverse-transcriptase PCR analysis revealed that both DC subpopulations spontaneously expressed IL-1 α , IL-1 β , IL-6, IL-7, IL-12 (p35 and p40), IL-15, IL-18, TNF- α , TGF- β , macrophage CSF, and granulocyte-macrophage CSF, but not IL-2, IL-3, IL-4, IL-5, IL-9, and IFN- β transcripts. Both subpopulations were shown to secrete IL-12 after CD40 triggering. Interestingly, only the CD14⁺-derived DC secreted IL-10 after CD40 activation, strengthening the notion that the two DC subpopulations indeed represent two independent pathways of DC development. Furthermore, both DC subpopulations expressed IL-13 mRNA and protein following activation with PMA-ionomycin, but not with CD40 ligand, in contrast to IL-12 and IL-10, revealing the existence of different pathways for DC activation. Finally, we confirmed the expression of IL-7, IL-10, and IL-13 mRNA by CD4+CD11c+CD3- DC isolated ex vivo from tonsillar germinal centers. Thus, CD14+-derived DC expressing IL-10 and factor XIIIa seemed more closely related to germinal center dendritic cells(GCDC) than to Langerhans cells.
